

STR Intelligence

One real investment problem.
Five agentic patterns.

The work was never just one search.

Evaluating one potential STR meant stitching together disconnected evidence—and repeating the same decisions for every property.

01	ZILLOW	Find the property
02	AIRBNB	Study nearby stays
03	SHEETS	Assemble assumptions
04	CALCULATOR	Test the economics

WEEK 3
REFRAME

Not one
giant AI
prompt.

A system
of
patterns.

01 · ROUTE

Deterministic first. Agentic where it helps.

Natural language becomes structured filters. LangGraph chooses the branch; TypeScript owns the rules.

02 · SEQUENCE

Make every transition explicit.

SCRAPE → NORMALIZE → VALIDATE → DEDUPLICATE → SAVE

Each step updates shared state, contains malformed records, and leaves evidence for the next decision.

Memory should change what the system does next.

Before calling a paid Airbnb provider, the workflow asks Supabase what it already knows.

CHECK SAVED EVIDENCE

HUMAN-IN-THE-LOOP

The system can rank and calculate. The investor still controls paid actions, assumptions, deeper analysis, and the final decision.

Use the model where interpretation adds value.

Photos + listing facts are evaluated only on request—and only when enough evidence exists. Routing, scoring, persistence, and financial math remain deterministic.

MY WEEK 3 TAKEAWAY

Reliable agents do not need unlimited autonomy. They need better structure.
